Abstract: Let \((E, A, B, C)\) be a quadruple of matrices with \(E, A \in M_n(\mathbb{C}), B \in M_{n \times m}(\mathbb{C}), C \in M_{p \times n}(\mathbb{C})\) representing a singular time-invariant linear system, \(E \dot{x} = Ax + Bu, y = Cx\).

In this paper we present a collection of invariants for singular systems in terms of ranks of certain matrices, that permit us to reduce the system in a canonical form in such a way that the system is decomposed in following five independent subsystems: i) controllable and observable system, ii) controllable non observable system, iii) observable non controllable system, iv) Jordan system v) completely singular system.

Key-Words: Singular systems, proportional and derivative feedback, proportional and derivative output injection, canonical forms.

1 Introduction

Let us consider a finite-dimensional singular linear time-invariant system \(E \dot{x}(t) = Ax(t) + Bu(t), y = Cx\), where \((E, A, B, C) \in M = M_n(\mathbb{C}) \times M_n(\mathbb{C}) \times M_{n \times m}(\mathbb{C}) \times M_{p \times n}(\mathbb{C})\).

Different useful and interesting equivalence relations between singular systems have been defined. We deal with the equivalence relation \((E', A', B', C') = (QEP + QBF_E + F_C^E CP, QAP + QBF_A + F_C^A CP, QBR, SCP)\), with \(P, Q \in \text{Gl}(n; \mathbb{C}), R \in \text{Gl}(m; \mathbb{C}), S \in \text{Gl}(p; \mathbb{C}), F_B^E, F_B^A \in M_{m \times n}(\mathbb{C}), F_C^C, F_C^P \in M_{n \times p}(\mathbb{C})\), that is to say the equivalence relation accepting one or more, of the following standard transformations: basis change in the state space, input space, proportional and derivative feedback, proportional and derivative output injection and premultiplication by an invertible matrix.

It is easy to check that this relation is an equivalence relation.

Systems \((E, A, B, C) \in M\), for which there exist matrices \(F_B^E\) and \(F_C^C\) such that the matrix \(E + BF_E^B + F_C^E C\) is invertible are called standardizable because of by means a proportional and derivative feedback, the system is reduced to an standard system.

Systems \((E, A, B, C) \in M\), for which there exist matrices \(F_B^E, F_C^C, F_B^A\) and \(F_C^E\) such that the pencil \(s(E + BF_E^B + F_C^E C) + (A + BF_A^B + F_C^C A)\) is regular (i.e. \(\det s(E + BF_E^B + F_C^E C) + (A + BF_A^B + F_C^C A) \neq 0\) for some \(s \in \mathbb{C}\)), are called regularizable. Remember that regular systems are those such that there exists a unique solution for some consistent initial condition.

Obviously, regularizable character is invariant under equivalence relation considered.

The equivalence relation permit us to reduce regularizable systems to the following re-
duced form.

**Proposition 1** Let \((E, A, B, C) \in M\) be a \(n\)-dimensional \(m\)-input regularizable singular system. Then, it can be reduced to \((E', A', B', C')\) with \(E' = \begin{pmatrix} I_1 \\ N_1 \end{pmatrix}\), \(A' = \begin{pmatrix} A_c \\ I_2 \end{pmatrix}\), \(B' = \begin{pmatrix} B_c \\ 0 \end{pmatrix}\), \(C' = \begin{pmatrix} C_c & 0 \end{pmatrix}\) where \((A_c, B_c, C_c)\) is in its Kronecker canonical form as a triple representing a standard system (see [3]), and \(N_1\) is a nilpotent matrix in its Jordan reduced form.

Loiseau, Ölçadiram and Malabre in [4] in the case of triples of matrices, consider the restricted pencil \(s\pi E - \pi A\) where \(\pi\) is the projection of state space over \(\text{Im} B\), and they prove that two triples are equivalent if and only if the associated restricted pencils are strictly equivalent, consequently a singular system \((E, A, B)\), can be reduced to

\[
\begin{pmatrix}
0 \\
I_1
\end{pmatrix}, \begin{pmatrix}
0 \\
A'_1
\end{pmatrix}, \begin{pmatrix}
I_r \\
0 \\
0
\end{pmatrix}
\]

where \((E'_1, A'_1)\) is the Kronecker canonical reduced form of the pencil \(s\pi E + \pi A\). García-Planas and Magret in [2] obtain the same result using polynomial matrices.

Remember that a standard system in its Kronecker reduced form is partitioned in three independent subsystems (see [1] for example): i) \(\dot{x}_1 = A_1 x_1 + B_1 u_1, y_1 = C_1 x_1\) controllable and observable, ii) \(\dot{x}_2 = A_2 x_2 + B_2 u_2\) controllable, iii) \(\dot{x}_3 = A_3 x_3, y_2 = C_2 x_3\) observable, iv) \(x_4 = A_4 x_4\), all of them in its corresponding canonical reduced form.

In this paper, we present a collection of invariants that permit us to obtain the canonical form for all regularizable systems.

### 2 Collection of invariants

First of all, we remember the equivalence relation considered over the space \(M\) of quadruples of matrices.

**Definition 1** Two quadruples \((E', A', B', C')\) and \((E, A, B, C)\) in \(M\) are called equivalent if, and only if, they exist matrices \(P, Q \in \text{Gl}(n; \mathbb{C}), R \in \text{Gl}(m; \mathbb{C}), S \in \text{Gl}(p; \mathbb{C}), F_E^B, F_A^B \in M_{m \times n}(\mathbb{C}), F_E^C, F_A^C \in M_{n \times p}(\mathbb{C})\), such that \((E', A', B', C') = (Q E P + Q B F_E^B + F_E^C P, Q A P + Q B F_A^B + F_A^C P, Q B R, S C P)\). with \(P, Q \in \text{Gl}(n; \mathbb{C}), R \in \text{Gl}(m; \mathbb{C}), S \in \text{Gl}(p; \mathbb{C}), F_E^B, F_A^B \in M_{m \times n}(\mathbb{C}), F_E^C, F_A^C \in M_{n \times p}(\mathbb{C})\), or in a matrix form

\[
\begin{pmatrix}
E' \\
B'
\end{pmatrix}
= \begin{pmatrix}
Q & F_E^C \\
Q & F_A^C
\end{pmatrix}
\begin{pmatrix}
E \\
B
\end{pmatrix}
+ \begin{pmatrix}
P & R \\
P & F_A^B
\end{pmatrix}
\]

It is easy to check that this relation is an equivalence relation.

Now, we consider a list of ranks of a certain matrices associated to the matrices \(E, A, B, C\) in the triple \((E, A, B, C) \in M\).

**Proposition 2** Two quadruples \((E, A, B, C), (E', A', B', C')\) are equivalent under equivalence relation considered, if and only if the pencils \(s \begin{pmatrix} E & B \\ C & 0 \end{pmatrix} \) and \(s \begin{pmatrix} E' & B' \\ C' & 0 \end{pmatrix} \) are strictly equivalent.

So, the collection of Kronecker-invariants classifies these kind of pencils (see [3, 5, 6], for example). Nevertheless, we are interested in emphasizes the structure of the system. And as in the standard systems we are interested in to obtain a decomposition of the system in the following independent subsystems:

\[
\begin{align*}
\dot{x}_1 &= A_1 x_1 + B_1 u_1, y_1 = C_1 x_1, \\
\dot{x}_2 &= A_2 x_2 + B_2 u_2, \\
\dot{x}_3 &= A_3 x_3, y_2 = C_2 x_3, \\
x_4 &= A_4 x_4, \\
x_5 &= A_5 x_5
\end{align*}
\]

all of them in its canonical reduced form, that is to say matrices \(A_c, B_c, C_c\) in Proposition 1, are \(A_c = \text{diag}(A_1, A_2, A_3, A_4)\), \(B = \begin{pmatrix} B_1 & 0 \\ 0 & B_2 \\ 0 & 0 \end{pmatrix}\), \(C_c = \begin{pmatrix} C_1 & 0 & 0 & 0 \\ 0 & C_2 & 0 \end{pmatrix}\).
Now, we consider a list of ranks (denoted by \( \text{rk} \)), of a certain matrices associated to the matrices \( E, A, B, C \) in the quadruple \( (E, A, B, C) \in M \).

**Definition 2**  We consider the following numbers

1) \( r^0 = \text{rk} \left( \begin{array}{cccc} E & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{array} \right) \), \( \forall \ell \geq 1 \)

2) \( r^0 = \text{rk} \left( \begin{array}{cccc} E & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{array} \right) \), \( \forall \ell \geq 1 \)

3) \( r^0 = \text{rk} \left( \begin{array}{cccc} E & A & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{array} \right) \), \( \forall \ell \geq 1 \)

4) \( r^0 = \text{rk} \left( \begin{array}{cccc} C & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{array} \right) \), \( \forall \ell \geq 1 \)

So,

\[
\text{rk} \left( \begin{array}{cc} E_1 & B_1 \\ C_1 & 0 \end{array} \right) = \\
\text{rk} \left( \begin{array}{c} Q \ F_E^C \\ S \end{array} \right) \left( \begin{array}{cc} E & B \\ C & 0 \end{array} \right) \left( \begin{array}{cc} P & 0 \\ F_E^B & R \end{array} \right).
\]

We denote by

\[
Q = \left( \begin{array}{cccc} Q & F_E^C & 0 & 0 \\ 0 & S & 0 & 0 \\ 0 & F_A^C & Q & F_E^C \\ 0 & 0 & 0 & S \end{array} \right)
\]

and

\[
P = \left( \begin{array}{cccc} P & 0 & 0 & 0 \\ F_E^B & R & 0 & 0 \\ F_A^B & 0 & F_E^B & R \end{array} \right)
\]

we have

\[
Q \cdot \text{rk} \left( \begin{array}{cccc} E & B & 0 & 0 \\ C & 0 & 0 & 0 \\ A & 0 & E & B \\ 0 & 0 & C & 0 \end{array} \right) \cdot P = \\
\left( \begin{array}{cccc} E_1 & B_1 & 0 & 0 \\ C_1 & 0 & 0 & 0 \\ A_1 & 0 & E_1 & B_1 \\ 0 & 0 & C_1 & 0 \end{array} \right)
\]

**Proposition 3**  In the set \( M \) of singular systems, the \( r \)-numbers defined, as well the \( \lambda \in \mathbb{C} \) considered, are invariant under the equivalence relation considered.

**Proof.**  Let \( (E_1, A_1, B_1, C_1) \) be a quadruple in \( M \) equivalent to \( (E, A, B, C) \), then there exist matrices \( Q, P \in \text{Gl}(n; \mathbb{C}), R \in \text{Gl}(m; \mathbb{C}), S \in \text{Gl}(p; \mathbb{C}), F_E^B, F_A^B \in M_{m \times n}(\mathbb{C}) \) and \( F_E^C, F_A^C \in M_{n \times p}(\mathbb{C}) \) such that

\[
E_1 = QEP + F_E^C CP + QBF_E^B \\
A_1 = QAP + F_A^C CP + QBF_A^B \\
B_1 = QBR \\
C_1 = SCP.
\]
Analogously we can proof the invariance of the other numbers. □

The collection of \( r \)-numbers is called the system of discrete invariants and the collection of \( \lambda \in \mathbb{C} \) are called the system of continuous invariants or the set of eigenvalues of the system.

**Theorem 1** The \( r \)-numbers are a complete system of invariants and they permit us to describe the canonical reduced form for regularizable singular systems.

**Proof.** We are to show how we can deduce the canonical form from these collection of invariants.

We are going to distinguish two cases,

a) If \( r_0^c \geq n \) the system is standardizable then there are not subsystem v), and in this case we construct the following numbers, that they are invariant.

\[
\tilde{r}_\ell^c = r_\ell^c - n(\ell + 1), \forall \ell \geq 0
\]

and

\[
\begin{align*}
\rho_0^c &= \tilde{r}_0^c \\
\rho_1^c &= \tilde{r}_1^c - 2\tilde{r}_0^c \\
\rho_2^c &= \tilde{r}_2^c - \tilde{r}_1^c - (\tilde{r}_1^c - \tilde{r}_0^c) \\
&\vdots \\
\rho_n^c &= \tilde{r}_n^c - \tilde{r}_{n-1}^c - (\tilde{r}_{n-1}^c - \tilde{r}_{n-2}^c)
\end{align*}
\]

The \( \rho_\ell^c \)-numbers give the quantity of \((\ell + 1)\)-blocks appearing in the controllable and observable subsystem.

b) If \( r_0^c < n \) the system is not standardizable and there are subsystem v), in fact there are \( n - r_0^c \)-blocks in \( N_1 \).

In this case we construct the following invariant numbers

\[
\tilde{r}_\ell^c = r_\ell^c - r_0^c(\ell + 1), \forall \ell \geq 0
\]

and

\[
\begin{align*}
\rho_0^c &= \tilde{r}_0^c = 0 \\
\rho_1^c &= \tilde{r}_1^c - 2\tilde{r}_0^c \\
\rho_2^c &= \tilde{r}_2^c - \tilde{r}_1^c - (\tilde{r}_1^c - \tilde{r}_0^c) \\
&\vdots \\
\rho_n^c &= \tilde{r}_n^c - \tilde{r}_{n-1}^c - (\tilde{r}_{n-1}^c - \tilde{r}_{n-2}^c)
\end{align*}
\]

Let \( \nu \) be the least integer such that \( \rho_1 + \ldots + \rho_{\nu-1} < n - r_0^c \) and \( \rho_1 + \ldots + \rho_\nu \geq n - r_0^c \), partitioning \( \rho_\nu^c = \rho_\nu^c + \rho_\nu^c \) such that \( \rho_1 + \ldots + \rho_\nu = n - r_0^c \), so there are \( \rho_i \)-blocks of size \( i \) in the subsystem v), for \( 1 \leq i \leq r \), and \( \rho_i \)-blocks of size \( i + 1 \) in the controllable and observable subsystem for \( r + 1 \leq i \leq n \).

The number of blocks in the controllable and observable subsystem is

\[
t = \rho_{\nu+1} + \ldots + \rho_n.
\]

As a consequence we have that the \( \rho_\nu^c \)-numbers give us the canonical form for subsystem i) and v).

We observe that the size of the subsystem v) is \( n_2 = \rho_1 + 2\rho_2 + \ldots + (\nu - 1)\rho_{\nu-1} + \nu\rho_\nu^c \) and the size of the subsystem i) is \( n_1 = n - n_2 \).

Now we are going to analyze the \( r_i^c \)-numbers. They give us the canonical form for subsystem ii)

We consider the following (invariant) numbers \( \tilde{r}_0^c = r_0^c \), \( \tilde{r}_\ell^c = r_\ell^c - \ell n, \forall \ell \geq 1 \) and

\[
\begin{align*}
\rho_0^c &= \tilde{r}_0^c - t \\
\rho_1^c &= \tilde{r}_1^c - \tilde{r}_0^c - t, \\
&\vdots \\
\rho_n^c &= \tilde{r}_n^c - \tilde{r}_{n-1}^c - t,
\end{align*}
\]

This numbers verify

\[
\rho_0^c \geq \ldots \geq \rho_r^c > \rho_r^c = \ldots = \rho_0^c = 0.
\]

The size of the blocks in the subsystem ii) are the controllability indices of the system ii) and they are numbers of the conjugate partition of

\[
[r_0^c, \ldots, r_r^c].
\]

The \( r_i^o \)-numbers give us the canonical form for subsystem iii)

We consider the following (invariant) numbers \( \tilde{r}_0^o = r_0^o \), \( \tilde{r}_\ell^o = r_\ell^o - \ell n, \forall \ell \geq 1 \) and

\[
\begin{align*}
\rho_0^o &= \tilde{r}_0^o - t \\
\rho_1^o &= \tilde{r}_1^o - \tilde{r}_0^o - t, \\
&\vdots \\
\rho_n^o &= \tilde{r}_n^o - \tilde{r}_{n-1}^o - t.
\end{align*}
\]
This numbers verify
\[ \rho_0^0 \geq \ldots \geq \rho_r^0 > \rho_r^0 = \ldots = \rho_0^0 = 0. \]
The size of the blocks in the subsystem iii) are the observability indices of the system iii) and they are numbers of the conjugate partition of \([\rho_0^0, \ldots, \rho_r^0]\).

Finally, for each eigenvalue \(\lambda\) the \(r_i^1\)-numbers give the Segre characteristic defining the canonical form for the subsystem iv).

We consider for each eigenvalue \(\lambda_i\) the following (invariant) numbers
\[ r_i^1(\lambda_i) = r_i^1 - (\ell - 1)n - n_2 \]
and
\[ \rho_1^1(\lambda_i) = n - r_i(\lambda_i) + t \]
\[ \rho_2^1(\lambda_i) = r_i(\lambda_i) - r_2(\lambda_i) + t \]
\[ \vdots \]
\[ \rho_n^1(\lambda_i) = r_{n-1}(\lambda_i) - r_n(\lambda_i) + t. \]

The Segre characteristic corresponding to the eigenvalue \(\lambda_i\) is the conjugate partition of \([\rho_1^1(\lambda_i), \ldots, \rho_n^1(\lambda_i)]\).

\[ \Box \]

**Example 1** Let \((E, A, B, C)\) a quadruple with \(E = \begin{pmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 2 & -1 & 1 & 4 & 3 & 1 & 7 & -2 & 0 & 1 \\ 1 & 0 & 0 & 2 & 0 & 0 & 0 & 0 & 0 & 0 \\ 2 & 4 & -3 & 1 & 0 & 4 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{pmatrix}, \]
\(A = \begin{pmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ -1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{pmatrix}, \]
\(B = \begin{pmatrix} 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{pmatrix}, \]
\(C = \begin{pmatrix} 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{pmatrix} \)

So, computing the \(r\)-numbers we deduce the \(\rho\)-numbers obtaining
\[ \rho_1^{co} = 0, \rho_2 = \rho_2 + \rho_2 = 1 + 1, \rho_i^{co} = 0, \forall i > 2 \]
\[ t = 1, n_2 = 2 \]
\[ \rho_0^1 = 1, \rho_1^1 = 1 \]
\[ \rho_0^2 = 1, \rho_1^2 = 1 \]
\[ \rho_1^1(3) = 1, \rho_2^1(3) = 1 \]

Consequently the canonical reduced form is \((E', A', B', C')\) with
\[ E' = \begin{pmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{pmatrix}, \]
\[ A' = \begin{pmatrix} 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{pmatrix}, \]
\[ B' = \begin{pmatrix} 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{pmatrix}, \]
\[ C' = \begin{pmatrix} 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{pmatrix}. \]

The subsystems :

i) \(\dot{x}_1 = \begin{pmatrix} 0 & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 1 & 0 \end{pmatrix} x_1 + \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix} u_1, y_1 = \begin{pmatrix} 1 & 0 & 0 \end{pmatrix} x_1 \)

ii) \(\dot{x}_2 = \begin{pmatrix} 0 & 1 \\ 0 & 1 \end{pmatrix} x_2 + \begin{pmatrix} 0 \\ 0 \end{pmatrix} u_2, \)

iii) \(\dot{x}_3 = \begin{pmatrix} 0 & 1 \\ 0 & 1 \end{pmatrix} x_3, y_2 = \begin{pmatrix} 1 & 0 \end{pmatrix} x_3 \)

iv) \(\dot{x}_4 = \begin{pmatrix} 3 & 1/2 \\ 0 & 1/2 \end{pmatrix} x_4 \)

v) \(\dot{x}_5 = \begin{pmatrix} 0 & 1 \\ 0 & 1 \end{pmatrix} x_5. \)

**3 Conclusion**

In this paper a complete system of invariants for regularizable systems is presented. This collection is easily computerizable as a ranks of a certain matrices and permit us to describe the independent subsystems characterizing the control properties of the system.
